

Suggestion 3

This is my mammal life list. If I click on the map for Eastern Gorilla (circled in green), what opens is the next screen shot, which shows me a blank ocean space somewhere in the Pacific.

If I click however on the map for Eastern Mountain Gorilla (the sub-species that I have seen and have entered), circled in red in the first screen shot, then I get a correct map of my sighting of the sub-species, but not of the full species (for example if I had seen Eastern Lowland Gorilla, the sightings won't be displayed together with the Eastern Mountain Gorilla)
